

CE+ Tenable Agent Installation Guide

CA-TEST LTD · Prepared by Cyber Ask Ltd

Version 2026.05.06 · Generated 2026-05-06

Company	CA-TEST LTD
Agent Group	CATEST
Manager Host	cloud.tenable.com
Agent Linking Key	

1 Download the Tenable Nessus Agent

Download the appropriate Nessus Agent installer for your operating system from Tenable's official portal:

<https://www.tenable.com/downloads/nessus-agents>

Choose the latest stable release for your OS architecture (typically x86_64 / amd64). No Tenable account is required to download the agent.

2 Install the Agent

Linux (RPM or DEB package)

```
# RPM-based (RHEL, CentOS, Amazon Linux, Fedora)
sudo rpm -ivh NessusAgent-*.x86_64.rpm

# DEB-based (Ubuntu, Debian)
sudo dpkg -i NessusAgent-*.amd64.deb
```

macOS

```
sudo installer -pkg NessusAgent-*.pkg -target /
```

Windows (PowerShell — run as Administrator)

```
msiexec /i NessusAgent-*.msi /qn
```

3 Link the Agent to the Tenable Manager

Run the command for your operating system below. The linking key and agent group are pre-configured for **CA-TEST LTD** — copy and run exactly as shown. You must run these commands as root or Administrator.

Linux

```
sudo /opt/nessus_agent/sbin/nessuscli agent link --key= --groups="CATEST" --host=cloud.tenable.com --port=443
```

macOS

```
sudo /Library/NessusAgent/run/sbin/nessuscli agent link --key= --groups="CATEST" --host=cloud.tenable.com --port=443
```

Windows (PowerShell — run as Administrator)

```
& "C:\Program Files\Tenable\Nessus Agent\nessuscli.exe" agent link --key= --groups="CATEST" --host=cloud.tenable.com --port=443
```

4 Verify the Agent is Linked

After running the link command, the agent should appear in the Tenable manager under group **CATEST** within 1-2 minutes. To confirm locally:

Linux / macOS

```
sudo nessuscli agent status
```

Windows (PowerShell)

```
& "C:\Program Files\Tenable\Nessus Agent\nessuscli.exe" agent status
```

The output should include `Linked: yes` and show manager host `cloud.tenable.com`.

5 Troubleshooting

Agent not appearing in the manager? Ensure the machine has outbound HTTPS access on port 443 to `cloud.tenable.com`. Check corporate firewall and proxy settings. The agent does not require inbound connectivity.

Linking command returns an error? Confirm you are running as root (Linux/macOS) or Administrator (Windows). The linking key is case-sensitive and must be entered exactly as shown.

Agent service not starting after install?

Linux: `sudo systemctl enable --now nessusagent`

Windows: Open Services (services.msc) and start Tenable Nessus Agent manually.

Still stuck? Email your Cyber Ask assessor with the full console output of the link command, your OS version, and the names of any security/endpoint tools installed.
